PROFESSIONAL SUMMARY

Backend engineer with 4+ years shipping production APIs and blockchain systems, now focused on **Solidity** and **ERC-4337 account abstraction** on **BNB Smart Chain**. Built a custom on-chain policy layer (**BreakerRegistry** + a Kernel v3 module) enforcing per-trade, daily, and drawdown caps at the account-contract level, plus a PancakeSwap v3 venue layer with TWAP-based pricing guards against pool manipulation. Backend core in **Python (Django, FastAPI)** and **TypeScript**, with prior experience leading code reviews, defining architectural standards, and mentoring engineers. Seeking a remote backend or smart-contract engineering role.

EXPERIENCE

Senior Developer

Ighodalo Labs | Lagos, Nigeria | December 2025 – Present

- Established Git workflow standards across the engineering team (feature branches, PR reviews, merge policies), reducing integration conflicts and improving release cadence.
- Architected strict dev/production environment separation for all internal projects, eliminating a whole class of deployment-related bugs.
- Led weekly code reviews and introduced Trello-based sprint tracking, improving ticket completion rates and team accountability.
- Mentored junior developers on backend architecture, REST API design, and Python best practices, reducing onboarding time significantly.
- Refactored core backend modules across ongoing projects, reducing technical debt and increasing test coverage.

Backend Developer

Panda Tech | Remote | July 2025 – December 2025

- Designed and shipped scalable REST APIs powering the core product, improving response performance through query optimisation and strategic caching.
- Built blockchain integrations — token analytics, wallet event processing, and on-chain data pipelines — enabling real-time crypto features for end users.
- Leveraged cloud infrastructure to improve system availability and support horizontal scaling under load.
- Conducted regular code reviews, maintaining quality standards and supporting smooth onboarding of new team members.

Technical Consultant

FarmSquare | Remote | December 2025 – January 2026

- Served as technical consultant on an agricultural marketplace platform connecting farmers, buyers, and agents across Nigeria.
- Advised on product architecture, reviewed implementation decisions, and ensured delivery met production standards.
- Coordinated Paystack payment integration and provided guidance on platform scalability and deployment.

Technical Consultant & Senior Developer

AlgoTrading with Ighodalo | Remote | January 2026 – March 2026

- Led the architecture and delivery of a professional algorithmic trading platform for MetaTrader 5 Expert Advisors.
- Defined engineering standards, reviewed all implementation, and oversaw a junior developer's delivery end-to-end.
- Ensured secure EA packaging, client management workflows, and a smooth production deployment on a custom domain.

Backend Developer

ITMS, University of Ibadan | Ibadan, Nigeria | September 2024 – May 2025

- Designed and built a Django backend managing the full ID card production lifecycle for **10,000+ students** — tracking status from submission through to collection.
- Implemented secure student lookup, real-time status updates, and role-based admin workflows, replacing a fully manual institutional process.
- Enforced data consistency through ORM constraints and comprehensive input validation, ensuring accurate real-world representation.
- Delivered a production system actively used daily by institutional staff — a real shipped product, not a tutorial.

Backend Developer

Renager | Remote | August 2021 – October 2022

- Integrated third-party APIs and payment services, expanding platform functionality and improving user engagement.
- Applied microservices architecture patterns, improving system modularity, fault isolation, and service reliability.
- Developed authentication and data-protection middleware, hardening the platform against common web security vulnerabilities.
- Partnered with frontend engineers via RESTful API contracts to deliver seamless cross-stack user experiences.

SELECTED PROJECTS

Warden — Self-Hosted Trading Agents (BNB Smart Chain)

Solidity | ERC-4337 | Kernel v3.3 | TypeScript | Next.js | Electron | PancakeSwap v3
github.com/kunmmi/warden

- Port and re-architecture of an upstream trading-agent project onto BNB Smart Chain. Built the PancakeSwap v3 venue layer, a 15-minute TWAP valuation model with pool-depth and price-divergence guards, and the on-chain token registry.
- Designed BreakerRegistry + KernelBreakerPolicy, a custom Kernel v3 module (type 5) that enforces per-trade, daily, and drawdown caps at the account-contract level — caps hold even if the off-chain agent is fully compromised.

Token Launch Intelligence

TypeScript | Multi-Venue On-Chain Execution | Pump.fun | Pons | Flap
github.com/kunmmi/token-launch-intel

- Real-time, multi-venue token-launch intelligence platform with actual on-chain launch execution (not just monitoring) across Pump.fun, Pons, and Flap.

Predict Market

TypeScript | Next.js | PostgreSQL | Supabase | GitHub Actions | Vercel
predict-market-xi.vercel.app | github.com/kunmmi/Predict-market

- Crypto prediction market MVP with binary yes/no trading, in-app wallets, and a full referral/commission system for promoters.
- Implemented Row-Level Security in Supabase, cron-job market settlement, and real-time balance tracking with end-to-end TypeScript type safety.

FarmSquare Connect

AgriTech | Paystack | REST API | Vercel
farmsquare-connect-main.vercel.app

- Agricultural marketplace platform connecting farmers, buyers, and agents across Nigeria — consulted as Technical Lead on architecture and delivery.
- Advised on Paystack payment integration, product architecture decisions, and ensured the platform met production standards before launch.

AlgoTrading with Ighodalo

MetaTrader 5 | Expert Advisors | Python | Custom Domain
algotradingwithighodalo.xyz

- Professional algorithmic trading platform for MT5 Expert Advisors — led as Senior Developer, overseeing a junior developer's end-to-end implementation.
- Defined engineering standards, managed secure EA packaging and client delivery workflows, and oversaw production deployment to a custom domain.

Whisper — Real-time Chat Platform

Node.js | Socket.IO | Express | JWT / bcrypt | React | SQLite
whisper-chat-flow.vercel.app | github.com/kunmmi/whisper

- Full-stack messaging platform with WebSocket delivery, group chats (50 members), typing indicators, read receipts, and offline message queuing.
- Architected across 6 development phases with JWT auth, paginated message history, and a comprehensive test suite.

Invoice Automation System

TypeScript | GitHub Actions | Monday.com API | Cron Schedule
github.com/kunmmi/ccc-invoice-automation

- GitHub Actions workflow auto-generating monthly contractor invoices via Monday.com API, running the 1st of every month at 05:00 UTC.
- Prevents duplicate billing and auto-populates status, due dates, and service classification — zero manual intervention required.

EDUCATION

Bachelor of Science in Computer Science

University of Ibadan, Ibadan, Nigeria | 2020 – 2025

TECHNICAL SKILLS

Languages	Python | TypeScript | JavaScript | SQL | Bash
Frameworks	Django | FastAPI | Node.js | Express | Next.js | React | SQLAlchemy | Socket.IO
Databases	PostgreSQL | MySQL | SQLite | Supabase (Row-Level Security)
Blockchain / Web3	Solidity | ERC-4337 Account Abstraction | BNB Smart Chain | Ethereum | Hyperledger | Web3.py | EVM | DeFi Protocols
DevOps & Cloud	Git | GitHub Actions | Docker | AWS | Render | Vercel | Linux
Practices	REST API Design | Code Review | TDD | Microservices | CI/CD | Agile / Scrum
